

TRANSITION METALS - INTRODUCTION

Name Form

1) GENERAL PROPERTIES OF TRANSITION METALS

4s fills before 3d.
4s also empties before 3d.

Give the electron structure of the following atoms / ions (start from [Ar]).

Fe	Cu
Fe ³⁺	Cu ⁺
Sc	Cu ²⁺
Sc ³⁺	Zn
V	Zn ²⁺
V ²⁺	Cr

Definition of transition metal =

metal	atom	Common ions		Transition metal?
Sc	Sc [Ar]	Sc ³⁺ [Ar]		
Cu	Cu [Ar]	Cu ⁺ [Ar]	Cu ²⁺ [Ar]	
Zn	Zn [Ar]	Zn ²⁺ [Ar]		

The incomplete d sub-shell is responsible for a number of general properties of transition elements:

- 1)
- 2)
- 3)
- 4)

2) COMPLEX FORMATION

Some definitions

Ligand =

Complex =

Co-ordination number =

Lewis base =

Lewis acid =

Formation of complexes

Type of ligands

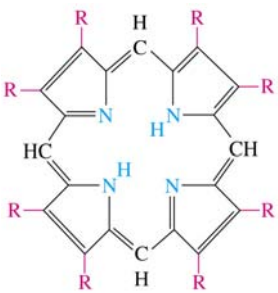

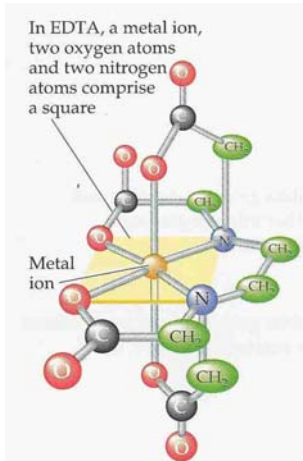

Unidentate ligands – ligands which form one co-ordinate bond to a metal ion

e.g.

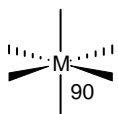

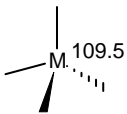

Bidentate ligands – ligands which form two co-ordinate bonds to a metal ion

Ligand	<p>1,2-diaminoethane (en)</p>	<p>ethanedioate ion (C₂O₄²⁻)</p>
Example complex	<p>[Cr(en)₃]³⁺</p>	<p>[Cr(C₂O₄)₃]³⁻</p>

Multidentate ligands – ligands which form more than two co-ordinate bonds to a metal ion

<p>Ligand</p>	<p style="text-align: center;">EDTA⁴⁻</p> $\begin{array}{c} \text{:OOC-CH}_2 \\ \\ \text{N-CH}_2\text{-CH}_2\text{-N:} \\ \\ \text{:OOC-CH}_2 \end{array} \quad \begin{array}{c} \text{CH}_2\text{-COO:}^- \\ \\ \text{N:} \\ \\ \text{CH}_2\text{-COO:}^- \end{array}$ <p style="text-align: center;">forms 6 bonds</p>	<p style="text-align: center;">porphyrin</p>  <p style="text-align: center;">forms 4 bonds</p>
<p>Example complex</p>	<p>In EDTA, a metal ion, two oxygen atoms and two nitrogen atoms comprise a square</p>  <p style="text-align: center;">Metal ion</p> <p style="text-align: center;">[Cu(EDTA)]²⁻</p>	<p style="text-align: center;">globin</p> $\begin{array}{c} \text{N:} \\ \\ \text{N:}-\text{Fe}^{2+}-\text{:N} \\ \\ \text{O}_2 \text{ or H}_2\text{O} \end{array}$ <p style="text-align: center;">haemoglobin</p> 

3) SHAPES OF COMPLEXES

	octahedral	tetrahedral	square planar	linear

4) FORMATION OF COLOURED IONS

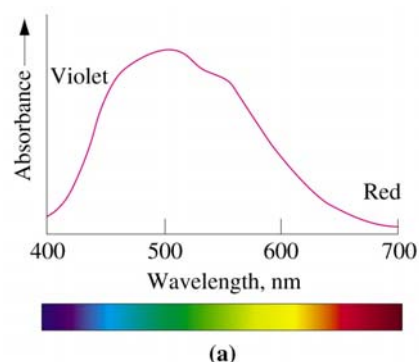

Why complexes are coloured

Factors that affect the colour

Ultraviolet/visible spectroscopy

- The frequencies at which a complex absorbs uv/visible light can be measured with a uv/visible spectrometer.
- Uv/visible light is passed through the complex, and the frequencies of uv/vis light passing through detected – those that do not pass through are absorbed.
- The more concentrated the solution the more light that is absorbed, so uv/vis can be used to measure the concentration of the solution.

Colorimetry

- The more concentrated the solution, the more it absorbs.
- This can be used to find the concentration of solutions – this is done in colorimeters.
- For some ions, a ligand is added to intensify the colour.
- The strength of absorption of solutions of known concentration is measured and a graph produced.
- The concentration of a solution of unknown concentration can be found by measuring the absorption and using the graph.
